About me

I was always interested in programming and technologies, but i didn't know how to pursue that interest professionally. My starting steps were small, crated few python scripts there, small android app written in kotlin here, but i wasn't feeling it, my eyes didn't glow and i wasn't interested in exploring it further.

This year i laid my gaze upon Frontend development, particularly React. I found online course from Yandex Practicum and after successfully completing it i can say one thing for sure, frontend is extremely fun and interesting, upon finishing my course project i learned a lot about React.js, Redux/toolkit, Typescript and many other things, now i can confidently and proudly call myself Junior Frontend Developer and i plan to improve my knowledge further.

I'm looking for internship or junior position where i could grow professionally, expand my knowledge and learn new tools and technologies. I think on-site work would be better and more efficient way to grow and that's why it's my main priority, but i also consider remote positions and relocation.
